

**IN THE SPECIFICATION**

Please amend page 6, line11 –page 5, line 4 as follows:

FIG. 4 shows the seal 10 having a set of perforated lines 19 that define lines of weakening in the seal and permits a user to easily and quickly remove the seal and gain access to the container's (5, 5a) contents. A user pulls the seal off along the set of perforated lines 19 and removes the seal from the container 5, 5a. The set of perforated lines can be provided with the seal as either a pull tab or perforated tear strip. The seal further includes a warning label 20 with indicia and other symbols 22 directing the preparer to the point of use, high risk medical preparation for this medicine container. The warning indicia and symbols 22 provide visual cues and tactile awareness different from the look and feel of the original container to distinguish the container's high alert medications from other medications. Tactile awareness is provided to the preparer or user because the preparer or user will not feel the pull tab until the seal 10 is removed. In this way, the preparer of the high risk medication container will be alerted to distinguish this medication from other sound-alike and look-alike drug names and packages that can lead medical staff and other health care professionals to unintended interchanges of drugs that can result in injury or death to the patient. The fact that the warning statement is integral with the seal provides assurance that the preparer will not open the container without first reading the warning statement on the seal.
